### A Gender-Based Lens on OPS Sworn Member Composition

Based on the OPS 2012 Workforce Census  
Human Rights Project, Phase 1

Prepared by

**Carina Fiedeldey-Van Dijk, PhD**

**October 2016**

## 1. Introduction and Background

When personal characteristics or behavior patterns is consciously or subconsciously used to categorize, stereotype, make generalizations and/or predictions about a person on the basis of his or her sex, gender, gender orientation, or gender transformation, issues of systemic bias usually arise in the workplace. Gender issues may occur among employees in an organization, and in the Ottawa Police Service (OPS) workforce in particular, where gender distribution is not balanced and policing was traditionally regarded as a male profession. Industries are regarded as male dominated when they employ 25% or fewer women. While the OPS qualifies as a male-dominated organization when its sworn side is considered, policing is not listed as the top 10 most male-dominated occupations in Canada where females represent less than 2% of all employees in an organization.

Male-dominated industries and occupations are particularly vulnerable to masculine stereotypes that make it more difficult for women to excel. Senior leadership dominated by men set the tone for talent management policies and practices where masculine stereotypes can influence placement, promotion, and development opportunities and systemic pro-male bias may exist such that it challenges the diversity in employee pools. The resulting occupational segregation then contributes to gender inequality.

On August 16, 2012, a human rights application was filed with the Human Rights Tribunal of Ontario (HRTO) by a sworn female OPS officer against the OPS Board. The complainant alleged discrimination in employment on the basis of gender and family status in accordance with compliance guidelines and standards as described in the *Human Rights Code* of Ontario. The HRTO is a provincial statute and an administrative, quasi-judicial tribunal tasked with hearing complaints that the Code has been violated. It has the power to grant damages and specific performance to remedy discriminatory acts. The HRTO is subject to judicial review by the Divisional Court of the Ontario Superior Court of Justice.

The Ontario Human Rights Commission (OHRC), which concentrates its resources on systemic discrimination, public education, and policy development, intervened on November 4, 2015 under Section 37 of the *Human Rights Code*, a law enacted in 1962 in the Canadian province of Ontario that gives all people equal rights and opportunities without discrimination in specific social areas such as employment on protected grounds such as sex, gender, and family status, among others. See <http://www.ohrc.on.ca/en/ontario-human-rights-code> for more information. The Code does not apply to federally regulated activities, which are subject to the Canadian Human Rights Act.

As part of the settlement of this case to be presented to the Ottawa Police Association (OPA) and the complainant, and to the OHRC, the OPS Board committed to undertake a series of actions to address the problems related to gender within the OPS. The first two steps, to be completed within 12 months of the settlement (i.e., November 2016), are tied to Phases 1 and 2 of an OPS human rights project aimed at addressing any systemic gender bias that may be present in its policies, procedures, and practices, especially on the sworn side of membership as the pressure point, and to encourage and support gender equality among its workforce. The two steps were:

1. **Phase 1.** To analyze the data collected in the OPS 2012 Workforce Census to determine the demographic character of employees with regards to gender and family status (or both, where applicable) at all levels and ranks.
2. **Phase 2.** To review all written and unwritten promotion and job placement policies, procedures and practices to ensure they do not discriminate on the basis of gender and/or family status at all levels and ranks, including but not limited to an evaluation of:
  - i. Requirements for job promotions and placements
  - ii. Opportunities for employees to meet those requirements, including access to training, job shadowing, and temporary acting roles

- iii. Advertising and recruitment for job promotion and placement opportunities
- iv. Selection processes used for job promotions and placements
- v. The impact of gender bias on job promotions and placements with regards to maternity and parental leave, and family caregiving.

The Phase-1 results provide a backdrop for a gender audit in Phase 2, with follow-up action planned for Phases 3-4 of the project. Conclusion of the settlement of this case includes the OPS Board's further commitment to ensure, within 24 months (i.e., by November 4, 2017), the finalization of the new and/or amended job promotion and placement policies, including procedural and structural elements to support these policies, and the provision of training to OPS members on these policies and on the new and/or amended human rights accommodation policy, as appropriate.

## **2. Key Findings**

This report details the findings of the the project's first phase, in which the OPS took a closer look at gender distribution among sworn members specifically as it relates to various demographic characteristics. A comprehensive analysis of the OPS 2012 Workforce Census data served to meet this need. Please refer to the Census report to fully appreciate the scope and detail of the information collected from its members, to which 85% of all OPS members responded. Key findings of the gender analysis are highlighted below, while detailed results organized by theme are presented in Appendix B.

Highlighted differences in key findings are based on statistical significance ( $p < 0.05$ ). Claims of found differences relate to the measure of a demographic variable means it is significantly larger or smaller than would be expected by chance alone. The level of statistical significance is expressed as a probability value  $p$ , denoting the probability that a result would be produced by chance alone, with the objective to conservatively minimize this effect as much as possible when considering differences in measurement.

The level of significance indicates the risk or probability of making an error in measurement (also called an alpha error, or a Type-I error). A Type-I error may involve incorrectly concluding that scores related to two groups (e.g., males versus females) are similar when they are in fact not, or wrongly deciding that a group score exceeds or is behind the value that would be expected by chance or a present ratio in a specific demographic group. The smaller the  $p$  value, the smaller the chance of a Type-I error and the more statistically significant the finding.

See Appendix A for an explanation of how to read the detailed tables in this report.

### **2.1 Gender within Sworn Membership Status**

Traditional identification as either male or female by the majority of OPS members enables meaningful comparisons across various demographic characteristics. These reveal valuable insights based on member composition of OPS men and women separately as a baseline for performing a gender audit.

A total of 1,643 OPS members completed the Census survey in 2012, of whom 1,114 were sworn members (including both males and females), and of whom 992 were male (including both sworn and civilian members). These figures render the possibility for cross-dimensional perspectives, which translate to the following overall depictions of membership status and gender distribution in the OPS:

**Figure 2.1: Gender-Based Membership Status**

Overall, there is almost one female (23.4%) for every three males (76.6%) in the OPS, considering sworn members only, which forms a baseline for all further comparisons. (When these figures are subjected to a more modern version of gender to include the category of *other*, 1.2% of the members identify with neither male nor female, whether identified as hetero- or homosexual.)

Apart from the differences in gender among sworn members in the OPS workforce, it is important to also consider other sworn member characteristics. The abovementioned gender ratios among sworn members were taken into account in comparing males and females in the next sections. Comparisons should always be made relative to these baseline ratios.

Found statistically significant differences may serve to further highlight distinct membership pockets existing in the OPS workforce and which may provide lenses to fully appreciate potential gender inequality in the OPS. Combined demographic characteristics can form entry points to investigate any claims or demonstrations of systemic bias and organizational non-compliance with gender equality in the workplace on the sworn side.

### 2.1.1 Directorates

Gender distribution is somewhat different in the 10 different OPS directorates surveyed, with 42.4% of all sworn members residing in Patrol Services. The gender-specific details for sworn members are graphed on the next page.

Differences in male-female ratios were found to be largest in Emergency Operations. Males significantly dominated females in Emergency Operations, while females dominated in Executive Services, in Resourcing and Development, and in Patrol Services.

**Figure 2.1.1a: Gender Distribution within Directorates**

Gender distribution within Patrol Services – see Figure 2.1.1b on the next page – was found to be fairly similar for the three divisions (West, Central, East). Similarity in scores (i.e., statistical non-significance) is dependent on how scores fittingly fall relative to all other scores in the graph, to the number of categories (i.e., response options, or bars in the graph), and to the number of observations in each category under consideration (preferably above five at a minimum). Scores are expected to fall along male-female ratio lines of the same colour as the score bars. The statistical test does not question the score ratios, but merely comments on individual scores' contingency to them.

**Figure 2.1.1b: Gender Distribution within Patrol Services**

### 2.1.2 Relational Partnership

As many as 42.3% of sworn females in the OPS reported a relational partner who was also an OPS member in 2012, which approaches an fairly even balance between OPS and non-OPS partners for sworn females. For male sworn members, the comparable statistics were only 15.8% with partners in the OPS; male sworn members overwhelmingly have relationship partners outside of the OPS. These numbers provide for an interesting comparison:

- 23.4% of females x 42.3% = 110 females in a partnership with OPS males
- 76.6% of males x 15.8% = 135 males in a partnership with OPS females

The discrepancy in numbers may indicate that some members were not comfortable to disclose their relationship with a colleague in fear of retribution, or that some of these members are in a relational partnership with an OPS member on the civilian side. Putting the numbers together, the percentage of sworn OPS members who were in a relational partnership with another OPS member is formally 21.7%, but may lie closer to 28.5% (covering the discrepancy) to 33.0% (accommodating those who chose not to answer this question) on the sworn side, and can be even higher if same-sex relationships especially among females are also considered as possibilities.

**Figure 2.1.2: Gender-Based Trends regarding Relational Partnership**

With supervisory status added to sworn male and female differences when a relational partnership with another OPS member was present, comparative to colleagues who kept their relationship outside of the OPS, this occurred significantly more among supervisory males and regular females, and less among regular males and supervisory females. It appears that relational partnership with an OPS colleague is not a direct factor for females to be promoted to supervisory status in the OPS, but rather the opposite. Conversely, relational partnerships between supervisory males with regular females inside the OPS stand out in relation to other partnership types inside and outside the OPS.

Relational partnership with another OPS member is stronger among regular members than members with supervisory status for both sworn males and females, though in statistically significantly different ratios. This may be indicative of natural age differences between men and women in relationships and in supervisory status, or perhaps it could have other root causes beyond the scope of the OPS Workforce Census.

### 2.1.3 Sexual Orientation

The findings indicated that 11.1% of sworn females are non-heterosexual (and mainly lesbian, bisexual), compared to male sworn members with 1.0% non-heterosexuality among them. Non-heterosexuality among females occurs more among regular members than among females with supervisory status. Bear in mind that overall, stated heterosexuality dominates among sworn members by 96.6%. Individuals who disclosed trans-gendered status were either male or female by sex.

#### **2.1.4 Supervisory Status**

When the 26.8% of OPS members with supervisory status as opposed to 73.2% regular members (i.e., those without supervisory status) are considered with respect to gender distribution in the OPS, the following depiction was revealed from the 2012 Workforce Census data:

**Figure 2.1.4: Gender Distribution within Supervisory Status**

Around 2012, gender distribution among sworn members was found to be statistically comparable between regular members and their supervisors.

#### **2.1.5 Rank**

In 2012, male sworn OPS members outranked female sworn OPS members in membership status positions of NCO (Sergeants, Staff Sergeants) in relation to overall sworn male-female ratios. In other positions the male-female ratios are proportionate to gender distribution among sworn members.

OPS  
Gender-Based Member Composition

At the higher ranks, the numbers become too small to continue direct percentage comparisons with that of lower ranks. Please refer to the tables in Appendix B for actual numbers. Bear in mind that Senior officers (sworn) and Directors (civilian) are grouped together in one category in the OPS 2012 Workforce Census, whereas lower rank categories are specific to sworn members.

**Figure 2.1.5: Gender Distribution within Rank**

## 2.1.6 Recruitment Efforts

Members can be distinguished based on whether they were hired before 2005, or between 2005-2012 through the OPS Outreach recruitment program. (The first OPS Workforce Census took place in 2005.) Since Census 2005, recruitment of sworn members skewed slightly towards (younger, regular) males compared to sworn recruitment ratios prior to Census 2005, though these differences were not statistically significant. In addition since Census 2005, recruitment of female sworn supervisors increased significantly above that of their male counterparts.

**Figure 2.1.6: Gender-Based Recruitment between Census 2005 and 2012**

### 2.1.7 Number of Direct Reports

Males and females differ significantly in the number of direct reports they supervised in 2012. Team sizes on the sworn side often consist of 5-8 members. Females tend to supervise teams of either 1-3 or 5, or 9-30 direct reports, while males tend to look after mid-size teams of 4, or 6-8 direct reports.

In the tables in Appendix B, the two larger groups of direct reports, namely 9-14 and 15-30 direct reports respectively, are grouped together to allow for meaningful comparisons. It is likely that some of the more senior members may have interpreted the term *direct reports* to stretch beyond the most direct, first level of reporting to them. Hence the last category in Figure 2.1.6 may be somewhat inflated.

**Figure 2.1.7: Gender-Based Responsibility for Number of Direct Reports**

## 2.2 Gender and Family Status

### 2.2.1 Relational Life

OPS sworn members overwhelmingly subscribe to family life: 81.2% were either married or in a common-law relationship in 2012. A further 11.3% stood in a relationship before they became widowed, divorced or separated and may still have been involved in family responsibilities. Comparatively, significantly more female than male sworn members were single or divorced, widowed, or in a common law relationship than married.

In other words, the traditional picture of a married police officer applies significantly more strongly to male than female sworn members, and especially among regular members (who are younger on average), rather than those with supervisory status. The traditional hallmarks of relational status among sworn members may be challenged even further when females become a higher target in recruitment efforts, and when highest numbers of married sworn members – male and female – were found among those with supervisory status (and older).

**Figure 2.2.1: Relational Life for Males versus Females**

## 2.2.2 Child and Dependent Care

A total of 69.0% and 61.5% sworn members reported that they are involved in child care and dependent care respectively (ranging from one to five dependents; i.e., 1.2 dependents on average). Sworn members have 2.2 dependents who are living with them on average, for whom either they or someone else provide weekly care responsibilities while at work in varying degrees. These numbers are statistically significantly different between male and female sworn members, and are significantly higher for regular members than for those with supervisory status.

Of the 61.5% sworn members who needed dependent care responsibilities provided by someone else (i.e., a spouse/partner, other relative, sitter/neighbour, nanny, childcare or eldercare facility, or other) while at work, 84.7% indicated this occurred infrequently, while 15.3% were involved in dependent care with a higher degree of frequency: either regularly, most of the time, or always.

The average number of dependents that members cared for was not statistically significantly different for sworn males and females in the OPS, nor for those with or without supervisory status. Similarly, males versus females were comparable with regards to having sole responsibility for dependent care provision while at work. On average, females reported less time spent on spousal, or spousal and childcare responsibilities than males.

The 2012 Workforce Census survey was sent out to all members who were not on extended accommodation leave at the time. The number of hours per week spent on unpaid, ongoing care comparatively leaned towards male members for hours of lower frequency (i.e., up to 34 hours per week) and towards female members for hours of higher frequency (i.e., especially 55+ hours per week) for the care of *children* specifically. This gender distinction was found to be statistically significant - see Figure 2.2.2a for a depiction on the next page.

**Figure 2.2.2a: Gender-Based Child Care Responsibility While at Work**

By comparison, for *dependent care* the same picture emerged than for child care, except that the switch point from males to females with regards to unpaid time spent in lower versus higher frequency in an average work week appeared to be earlier, at about 35 hours per week – see Figure 2.2.2b on the next page. In addition, the differences in time spent by males and females are not statistically significant overall.

**Figure 2.2.2b: Gender-Based Dependent Care Responsibility While at Work**

These patterns on time spent on child and dependent care are consistent for regular members and supervisory members alike where sample sizes prevailed: Sworn female members appear to be the stand-in while resuming work duties when care becomes more time-intensive. Fewer than 10% of members have the benefit of a full-time, stay-at-home spouse taking responsibility for dependent care while they work.

### 2.2.3 Other Care Activities

Female sworn members (whether in regular or supervisory positions) also reported a significantly higher number of hours per week that they put in for house and yard maintenance compared to their male colleagues. In addition, female members listed a higher number of free-time volunteering (males 1-3; females 4-5) activities they partake in weekly than male members.

## 2.3 Gender and Other Intersecting Diversity Characteristics

### 2.3.1 Potential for Being at Risk of Human Inequity

Human inequity is an aggregate that is determined by demographic factors other than gender, namely by those OPS members who self-identify as being a member of a visible minority and/or having a disability of some sort. According to the 2011 Canadian National Census, visible minorities are persons, other than Aboriginal peoples, who are non-Caucasian in race or non-white in colour. Aboriginal (Indigenous) peoples are persons who are North American Indian, Métis, or Inuit. Disabilities may include one or more impairments of the senses, dexterity (in any body parts), learning, mobility, speech and language, and cognition or intellect as they may occur in the OPS.

By these definitions, the portion of the OPS workforce potentially at risk of human inequity, i.e., those who may be subject to inequalities, comprised a total of 20.04% sworn members in 2012.

The Census findings indicate that those sworn members who may be subject to inequalities, were equally distributed among male and female members, and leaning insignificantly away from female sworn members. This picture changes when we look at different types of human inequity risk. Where present, visible minorities dominated among sworn males (specifically regular members), while disability (single or multiple) dominated among sworn females (again specifically regular members). By comparison, aboriginal status was equally distributed among male and female members.

**Figure 2.3.1: Gender Distribution Among Members who May Be Subject to Inequalities**

Proportionately, more Black and Asian Canadian members were male than female (and regular rather than supervisory members) in 2012. Visible minorities were proportionately significantly higher among males than females.

### 2.3.2 Spoken languages

Sworn females than males were comparable in their abilities to speak English, French, and other languages, as well as in the number of languages they can speak. The use of English above all other languages on the job dominated for at least two-thirds of sworn members, while close to half (47.9%) speak English only. The comparison carried through to males and females with either regular or supervisory membership status.

**Figure 2.3.2: Gender-Based Proficiency in Spoken Languages**

### 2.3.3 Age

The dominating category age for sworn members – both male and female – is 35-44 years with no statistically significant differences across the age categories overall.. Age is expected to correlate fairly strongly with tenure in the OPS, i.e., in the age categories of 45-54 years and 55-64 years, where males tended to dominate. Male supervisors are significantly older than female supervisors, whereas age among regular sworn members compare well.

**Figure 2.3.3: Gender Distribution within Age Category**

The only age category where the OPS falls just outside the label of male-dominance is between 35-44 years where the male-female ratio was found to be 73.8:26.2%. In the younger age category of 25-34 years the OPS relapsed to male dominance again.

#### 2.3.4 Ethnicity

One-third of sworn members identified with multiple ethnic groups themselves, through their lineage and by relational status. Identification with one or more groups in ethnic origin was equally well represented among male and female members, and among regular and supervisory members.

### 2.3.5 Religion

Overall religious distribution compared well between sworn males and females. Among those who identified with a religion, Muslim, Sikh, Christian or Buddhist males were distinguishable, while female Protestants stood out by comparison. The category of *no identified religion* was reported in stronger numbers among regular sworn members than among their supervisors.

### 2.3.6 Education

Slightly more sworn males than females reported their highest educational qualification to be at the secondary school up to college levels. Females appeared to be slightly higher qualified than males by dominating in categories denoting university education (from degree not completed, to post-bachelor degree completed). In reference to statistical significance to specific types of highes educational qualifications in particular, females compared to males stood out for low numbers in having a secondary school, trades certificate or diploma, and college without certificate or diploma qualification, and high numbers in their first university degree completed.

**Figure 2.3.6: Gender within Highest Educational Qualification**

Sworn members with supervisory status are significantly higher qualified than regular members, whereas male supervisors with Masters degree also stood out above all other colleagues.

Sworn females (supervisors and especially regular members) also reported to have more skills or certifications than their male colleagues.

### **3. Conclusion**

A gender-based lens on the OPS member composition sheds valuable light on the complexity within which possible systemic gender bias and inequality in the workforce should be considered. In some instances the comparative numbers support good practices, while in other cases, they may serve to help inform and address possible and realized experiences of gender inequality on the job.

---

**Notes:** The detailed findings include reporting of OPS member distribution and characteristics on the basis of sexual orientation (heterosexual versus non-heterosexual, trans-gender) to be as inclusive as possible, however numbers are very small in some categories; this information should be used with utmost discretion and interpretations from these tables need to be made with extreme caution.

If you require this document or any of the appendices in an alternate format, the request for alternate format document form is available at [ottawapolice.ca/accessibility](http://ottawapolice.ca/accessibility).

## Appendix A: How to Read the Tables

### Uni-Dimensional Tables

As an example, consider the age breakdown of members as extracted from the OPS 2012 Workforce Census results:

This format forms the base for considering bi-dimensional tables (also called cross-tabs) as explained on the next page.

## Bi-Dimensional Tables

This time, consider a cross-tabulated view of membership status by no dependent care responsibilities, also extracted from the OPS 2012 Workforce Census results:

The grey chi-square value in each cell of the table above indicates the strength of the contribution that cell makes to the significance reported below the table.

For example, the value of 19.652 in the top right cell (civilian members who do not have dependent care responsibilities) indicates the findings show in that cell attribute most to the differences found between cells/rows/columns.

Chi-square is the name of a statistical technique used here to determine the strength of association between the demographics tabled cross-dimensionally.

## Appendix B: Statistical Findings Pertaining to Gender Equality

Gender audit: Introduction to sworn member characteristics

Gender					
Q13A	Frequency	Percent	Cumulative Frequency	Cumulative Percent	
Male (59.9%)	833	76.6	833	76.6	
Female (40.1%)	255	23.4	1088	100.0
