**Reference:**       **Engineer's Report for the  
New Assessment Schedules under Section 76  
of the Drainage Act R.S.O. 1990 c. D17  
For Cranberry Creek Municipal Drain  
Our Project No. B21065**

Dear Sir:

This Engineer's Report provides new assessment schedules for the Cranberry Creek Municipal Drain. The Report was initiated at the request of the City of Ottawa to update the current assessment schedules for maintenance and repairs to account for changes of ownership, severances, land uses changes, and modifications to drainage area boundaries. The report is completed in accordance with Section 76 of the Drainage Act R.S.O. 1990, c. D17.

If you have any questions, please feel free to contact Lorne Franklin at [lfranklin@rcii.com](mailto:lfranklin@rcii.com), 613-791-1335 or Andy Robinson at [ajrobinson@rcii.com](mailto:ajrobinson@rcii.com), 613-761-0161.

Yours very truly,

ROBINSON CONSULTANTS INC.

A.J. Robinson, P.Eng.  
Drainage Engineer

## 1.0 INTRODUCTION

Robinson Consultants Inc. was appointed by the City of Ottawa on September 8, 2021 to complete an Engineer's Report for New Assessment Schedules for Cranberry Creek Municipal Drain in the City of Ottawa, geographic Township of North Gower. The Engineer's Report for new assessment schedules for maintenance and repairs of the Cranberry Creek Municipal Drain was initiated by the City of Ottawa to account for changes in ownership, severances, land use changes, and modifications to the drainage area boundary. The Engineer's Report and assessment schedules are completed under the authorization of Section 76 of the Drainage Act R.S.O. 1990, c. D17.

## 2.0 HISTORY

The Cranberry Creek Municipal Drain was originally constructed in 1895 under a report by Mr. Henry O. Wood, Eng. O.L.S. and was subsequently improved in 1953 under a report by R.F. Muckelstone, O.L.S.

A major improvement to the drain was completed under authority of By-Law No. 30-69 in accordance with the Engineer's Report, entitled "Engineer's Report – Cranberry Creek Municipal Drain – Township of North Gower" prepared by Graham, Berman and Associates Limited, dated March 24, 1969 (1969 Report). This document is the primary current governing report and By-Law.

The 1969 Report made provisions for the construction of the Foster Branch and the Bruce Branch as well as for maintenance of the main drain. The 1969 Report also made provisions for the installation of a pump-station complete with a 3HP-1100GPM (gallon per minute) electric pump and a dyke with a 4-foot spillway, constructed at station 128+00 imperial stationing (now 3+881.2 metric stationing) on the main drain.

The dyke and pump system was required to permit the water level in Cranberry Creek to be decreased below the summer operational water level of the Rideau River. Without the pumping facility the water levels for the Cranberry Creek Municipal Drain and Branches are impacted by the controlled level of the water in the Rideau River. The summer (operational) water level in the Rideau River is in turn controlled by the dam at Manotick with the level being raised in the spring providing controlled water elevations for navigation purposes (typically for the period of May through October).

Additional improvements were made to the dyke and pump station via a report by A.J. Graham Engineering Consultants Limited, entitled "Engineer's Report – Cranberry Creek Improvement Municipal Drain – Township of North Gower", dated Revised September 10, 1971 (1971 Report) and adopted by By-Law 28-71. The 1971 Report made provisions for improvements to Cranberry Creek Municipal Drain to permit more rapid draining of the watershed during the spring and fall of each year through the installation of two sluiceways. The constructed sluiceways consisted of the lower portion of a large structural plate culvert

through the dyke, with a stop log structure at the downstream end of each sluiceway. The intent of the stop log structure was to control the reverse flow of water during the summer period when the Rideau River water is high and when the pump is operating, while accommodating the free flow of the water around the control structure when the pump was not operating. The report also recommended that Council give consideration to the installation of a larger pump. Ultimately, a 10HP-3000 GPM electric pump was installed and used in the operation of the pump-station.

There have been a number of investigations and reports related to improvements to the Cranberry Creek Municipal Drain in subsequent years, including the Cranberry Creek Municipal Drain Engineer's Report, dated December 20, 2017, which was set aside by the Ontario Agriculture, Food and Rural Affairs Appeal Tribunal. Therefore, the 1969 Engineer's Report-Cranberry Creek Municipal Drain-Township of North Gower prepared by Graham Berman and Associates Limited (By-Law No. 30-69) with the modifications to the dyke and pump specified in the 1971 A.J. Graham Engineering Consultants Limited Engineer's Report continue to govern.

The limits of the Cranberry Creek Municipal Drain, main drain are shown on **Figure 2.1** and on Drainage Area Plan 21065-A1 in **Appendix A**.

### **3.0 ONSITE MEETING**

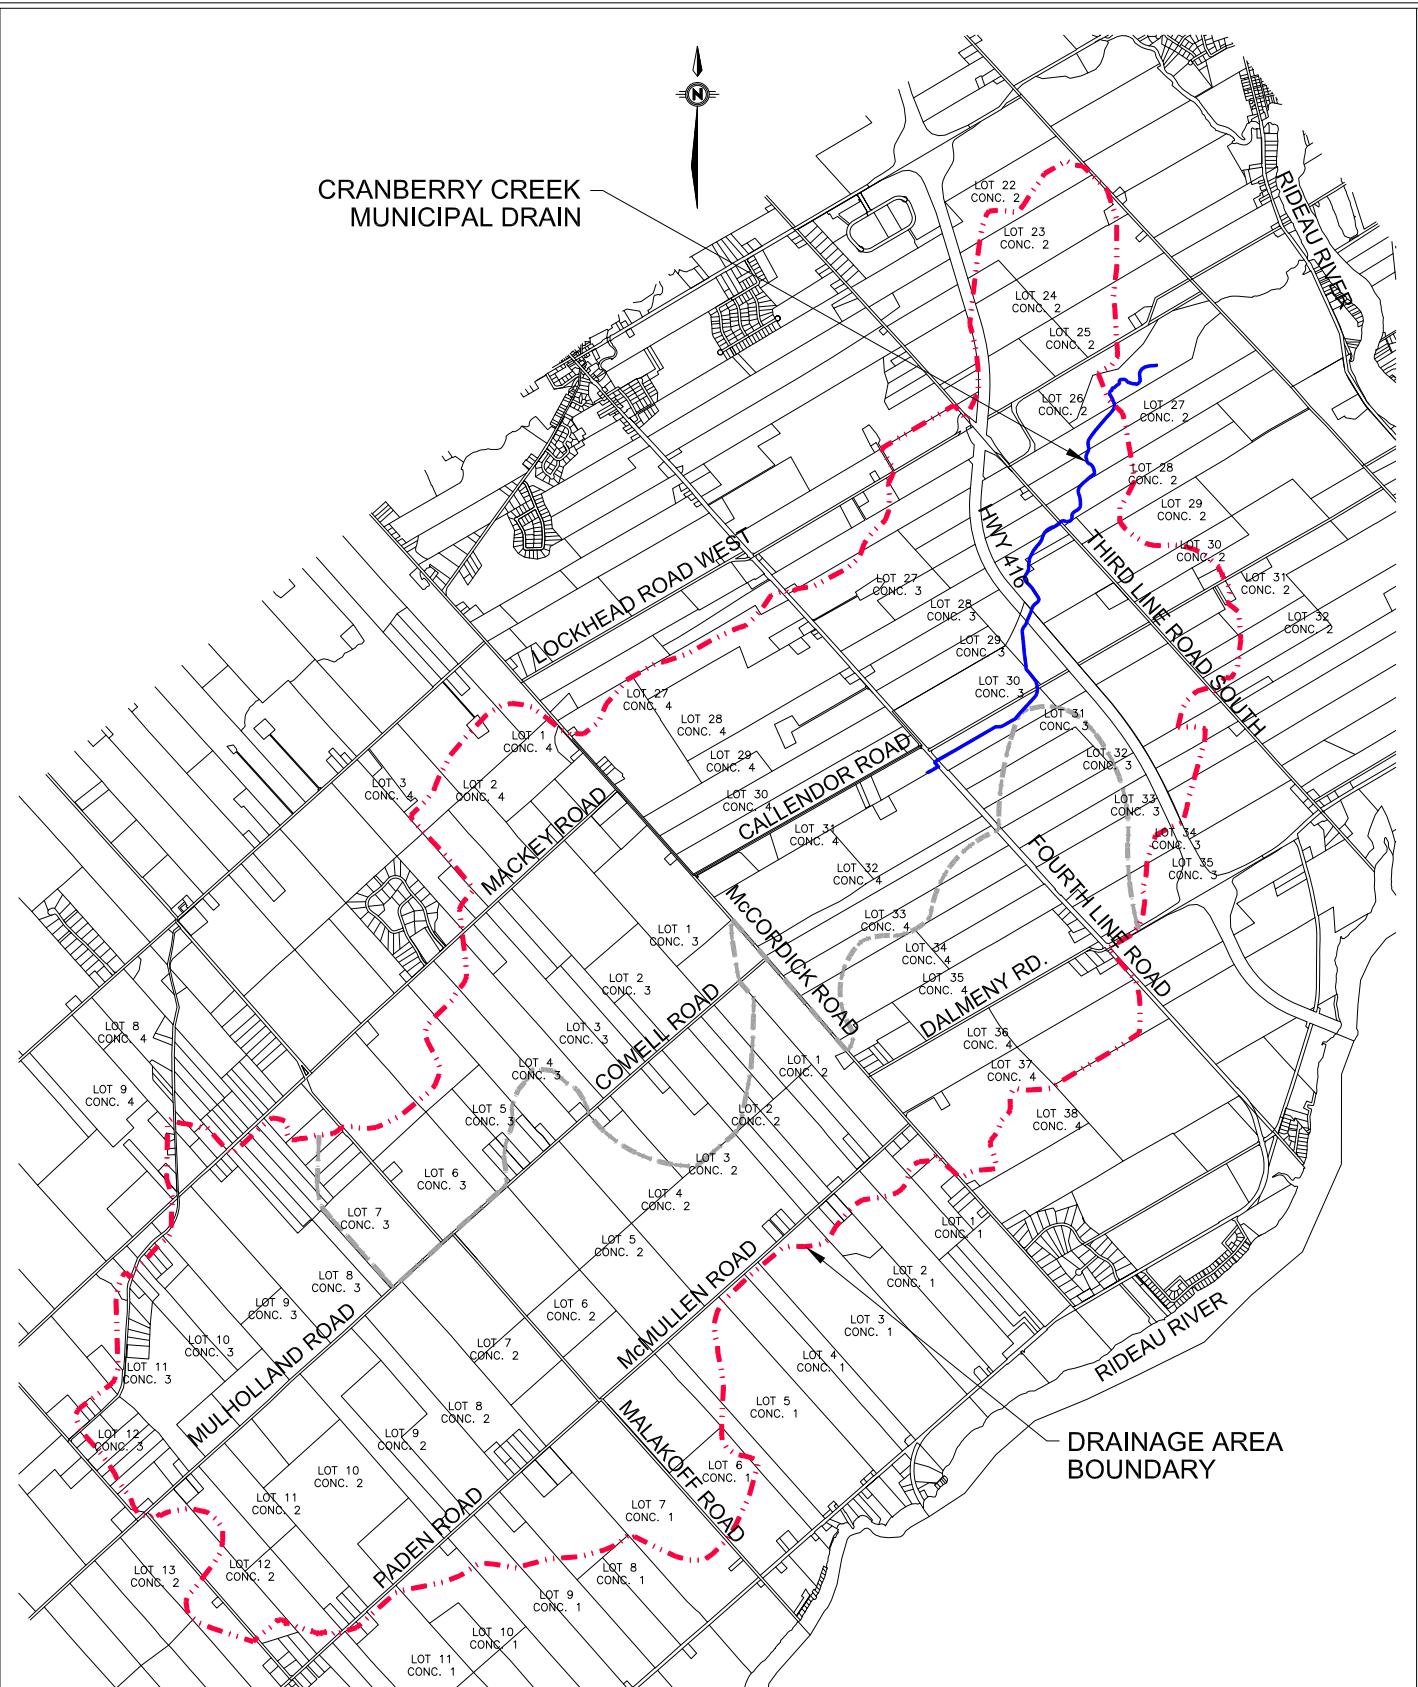

In accordance with the Drainage Act R.S.O. 1990, c. D17, the On-Site Meeting was held on November 9, 2021. In accordance with the existing City of Ottawa COVID protocol the meeting was held virtually via ZOOM.

### **4.0 CURRENT ASSESSMENT SCHEDULES**

The Assessment Schedules included in the Engineer's Report-Cranberry Creek Municipal Drain-Township of North Gower prepared by Graham Berman and Associates Limited and included in By-Law No. 30-69 continue to be the only Assessment Schedules available to the City to assess costs associated with maintenance and repair.

### **5.0 REQUIREMENT FOR NEW ASSESSMENT SCHEDULES**

Significant changes to properties, land use, and ultimately, the overall use of the drain have occurred since 1969. As such, the original 1969 Assessment Schedules are out of date. Revised Schedules of Assessment are required to reflect changes in property ownership, severances, changes in land use (including clearing and increased residential use), changes in the drainage area boundary, and ultimately to provide an equitable distribution of costs for future maintenance of the Cranberry Creek Municipal Drain.

**Robinson  
Consultants**

Title

## LOCATION PLAN

Fig. No.

2.1

Project

CRANBERRY CREEK MUNICIPAL DRAIN

Job No.

21065

Scale

NTS

Date

JUN 2022

As noted in the decision of the Ontario Agriculture, Food and Rural Affairs Appeal Tribunal "It is abundantly clear that Cranberry Creek Municipal Drain requires maintenance and minor improvements to the existing open channel system. No one objected to this work at the hearing."

For the City of Ottawa to respond to maintenance requests, revised Assessment Schedules must be completed to distribute the costs equitably to property owners in the drainage area.

## **6.0 ASSESSMENTS**

### **6.1 General**

The Drainage Act R.S.O 1990 c. D17 requires that the total estimated cost for maintenance and repair be assessed against the affected lands and roads under the categories of benefit (Section 22), outlet liability (Section 23), injuring liability (Section 23), special benefit (Section 24) and special assessment of public utility or road authority (Section 26). On this project there is no assessment for injuring liability.

### **6.2 Benefit**

Benefit as stated in the Drainage Act R.S.O. 1990 c. D17 is the "advantages to any lands, roads, building or other structures from the construction, improvement, repair or maintenance of a drainage works such as will result in a higher market value or increased crop production or improved appearance or better control of surface or subsurface water, or any other advantages relating to the betterment of lands, roads, buildings, or other structures".

### **6.3 Outlet**

Lands and roads that may be assessable for outlet liability are those lands that use a drainage works as an outlet or for which after construction or improvement of the drainage works an improved outlet is provided. The outlet or improved outlet may be provided either directly or indirectly through any drainage works, overland flow, swale, ravine, creek, or watercourse. Assessment for outlet is based on location, area, volume and rate of flow. However, as it is not practical to directly determine the rate and volume of flow for each individual property, generalization factors as described in the following sections are applied including the Land Use Factor, Distance Factor, Section Factor and Subsection Factor. These factors account for the typical rate and volume of flow from any hectare of land and account for land use, environmental factors (infiltration, evaporation, etc.) and temporary/minor impoundments as well as the portion of drain utilized.

## **6.4 Special Benefit/Special Assessment**

Special Benefit by definition under the Drainage Act, R.S.O. 1990 c. D17 is "any additional work or feature included in the construction, repair or improvement of a drainage works that has no effect on the functioning of the drainage works." A Special Benefit Assessment and/or a Special Assessment is charged against any owner, public utility, agency, authority, or municipality for which special consideration was required to accommodate special design consideration or a special feature.

A Special Benefit is assessed to each Road Authority for consideration of engineering analysis requirements (culvert sizing, etc.) and/or any special requirements related to road drainage for work downstream of the location (impacts of adjacent crossings, etc.).

No private landowner Special Benefits are anticipated for this project.

Any assessment for Special Benefit is shown on the Schedules of Assessment (**Appendix B**) as "Assessment for Special Benefit".

## **6.5 Grants**

The Drainage Superintendent will apply for any available provincial grant for properties that are eligible at the time that maintenance is completed.

## **6.6 Assessment Schedules**

The principles of assessment for municipal drains have evolved over time. At present, the recommended approach is to divide the drain into a series of sections in arriving at the ultimate benefit and outlet assessment schedules. This permits the cost estimates to be developed for each section and should result in a fair distribution of costs throughout the drainage basin. The division of the drain into sections is most beneficial for assessing the cost of future maintenance.

A technique that is employed to simplify the assessment process, involves converting all the lands within the watershed into a factored or equivalent area. In the case of benefit assessment, this includes the area of the land within the basin adjacent to the drain and a factor that is related to land use. In the case of outlet assessment, we use the area of the land within the drainage basin, the land use and a factor that represents the location of the land relative to the drain. For the location factor (or the distance from the drain), the principle is to apply a higher factor for lands that are closer to the drain, or to an outlet that connects directly into the drain, and a lower factor to lands that are more remote from the drain. The factored area method allows the Drainage Engineer to recognize that the volume and rate of flow of water varies with different land uses, soil types, surface conditions and distance from the drain. This method brings the entire area within a watershed to a common denominator and simplifies the application of outlet assessments.

Based on the principle that properties are only assessed for works that are undertaken downstream of the property in question, we have further introduced a factor within each section which divides the section into three equal parts (subsections) and applies a subsection factor to the outlet assessment.

Therefore, the properties that are within the downstream one-third of a section of drain, are in essence only using one-third of the total section of drain, whereas the lands that are in the upstream one-third or beyond, are using the whole section of the drain. Hence, we have applied what is called a subsection factor to the lands within the section of the drain where maintenance is being carried out. All of the lands upstream of the section where maintenance is being undertaken are also assessed a portion of the costs of the drainage works. The assessment on the lands upstream of the section where maintenance is being completed are charged a section factor equal to the most upstream portion of the lands within the section where the work is being completed.

## 6.7 Maintenance Sections

In order to develop schedules for future maintenance charges, the Cranberry Creek Municipal Drain has been divided into three sections as follows:

Section 1 is from Sta. 2+716.68 to Sta. 4+572.02

Section 2 is from Sta. 1+849.43 to Sta. 2+716.68

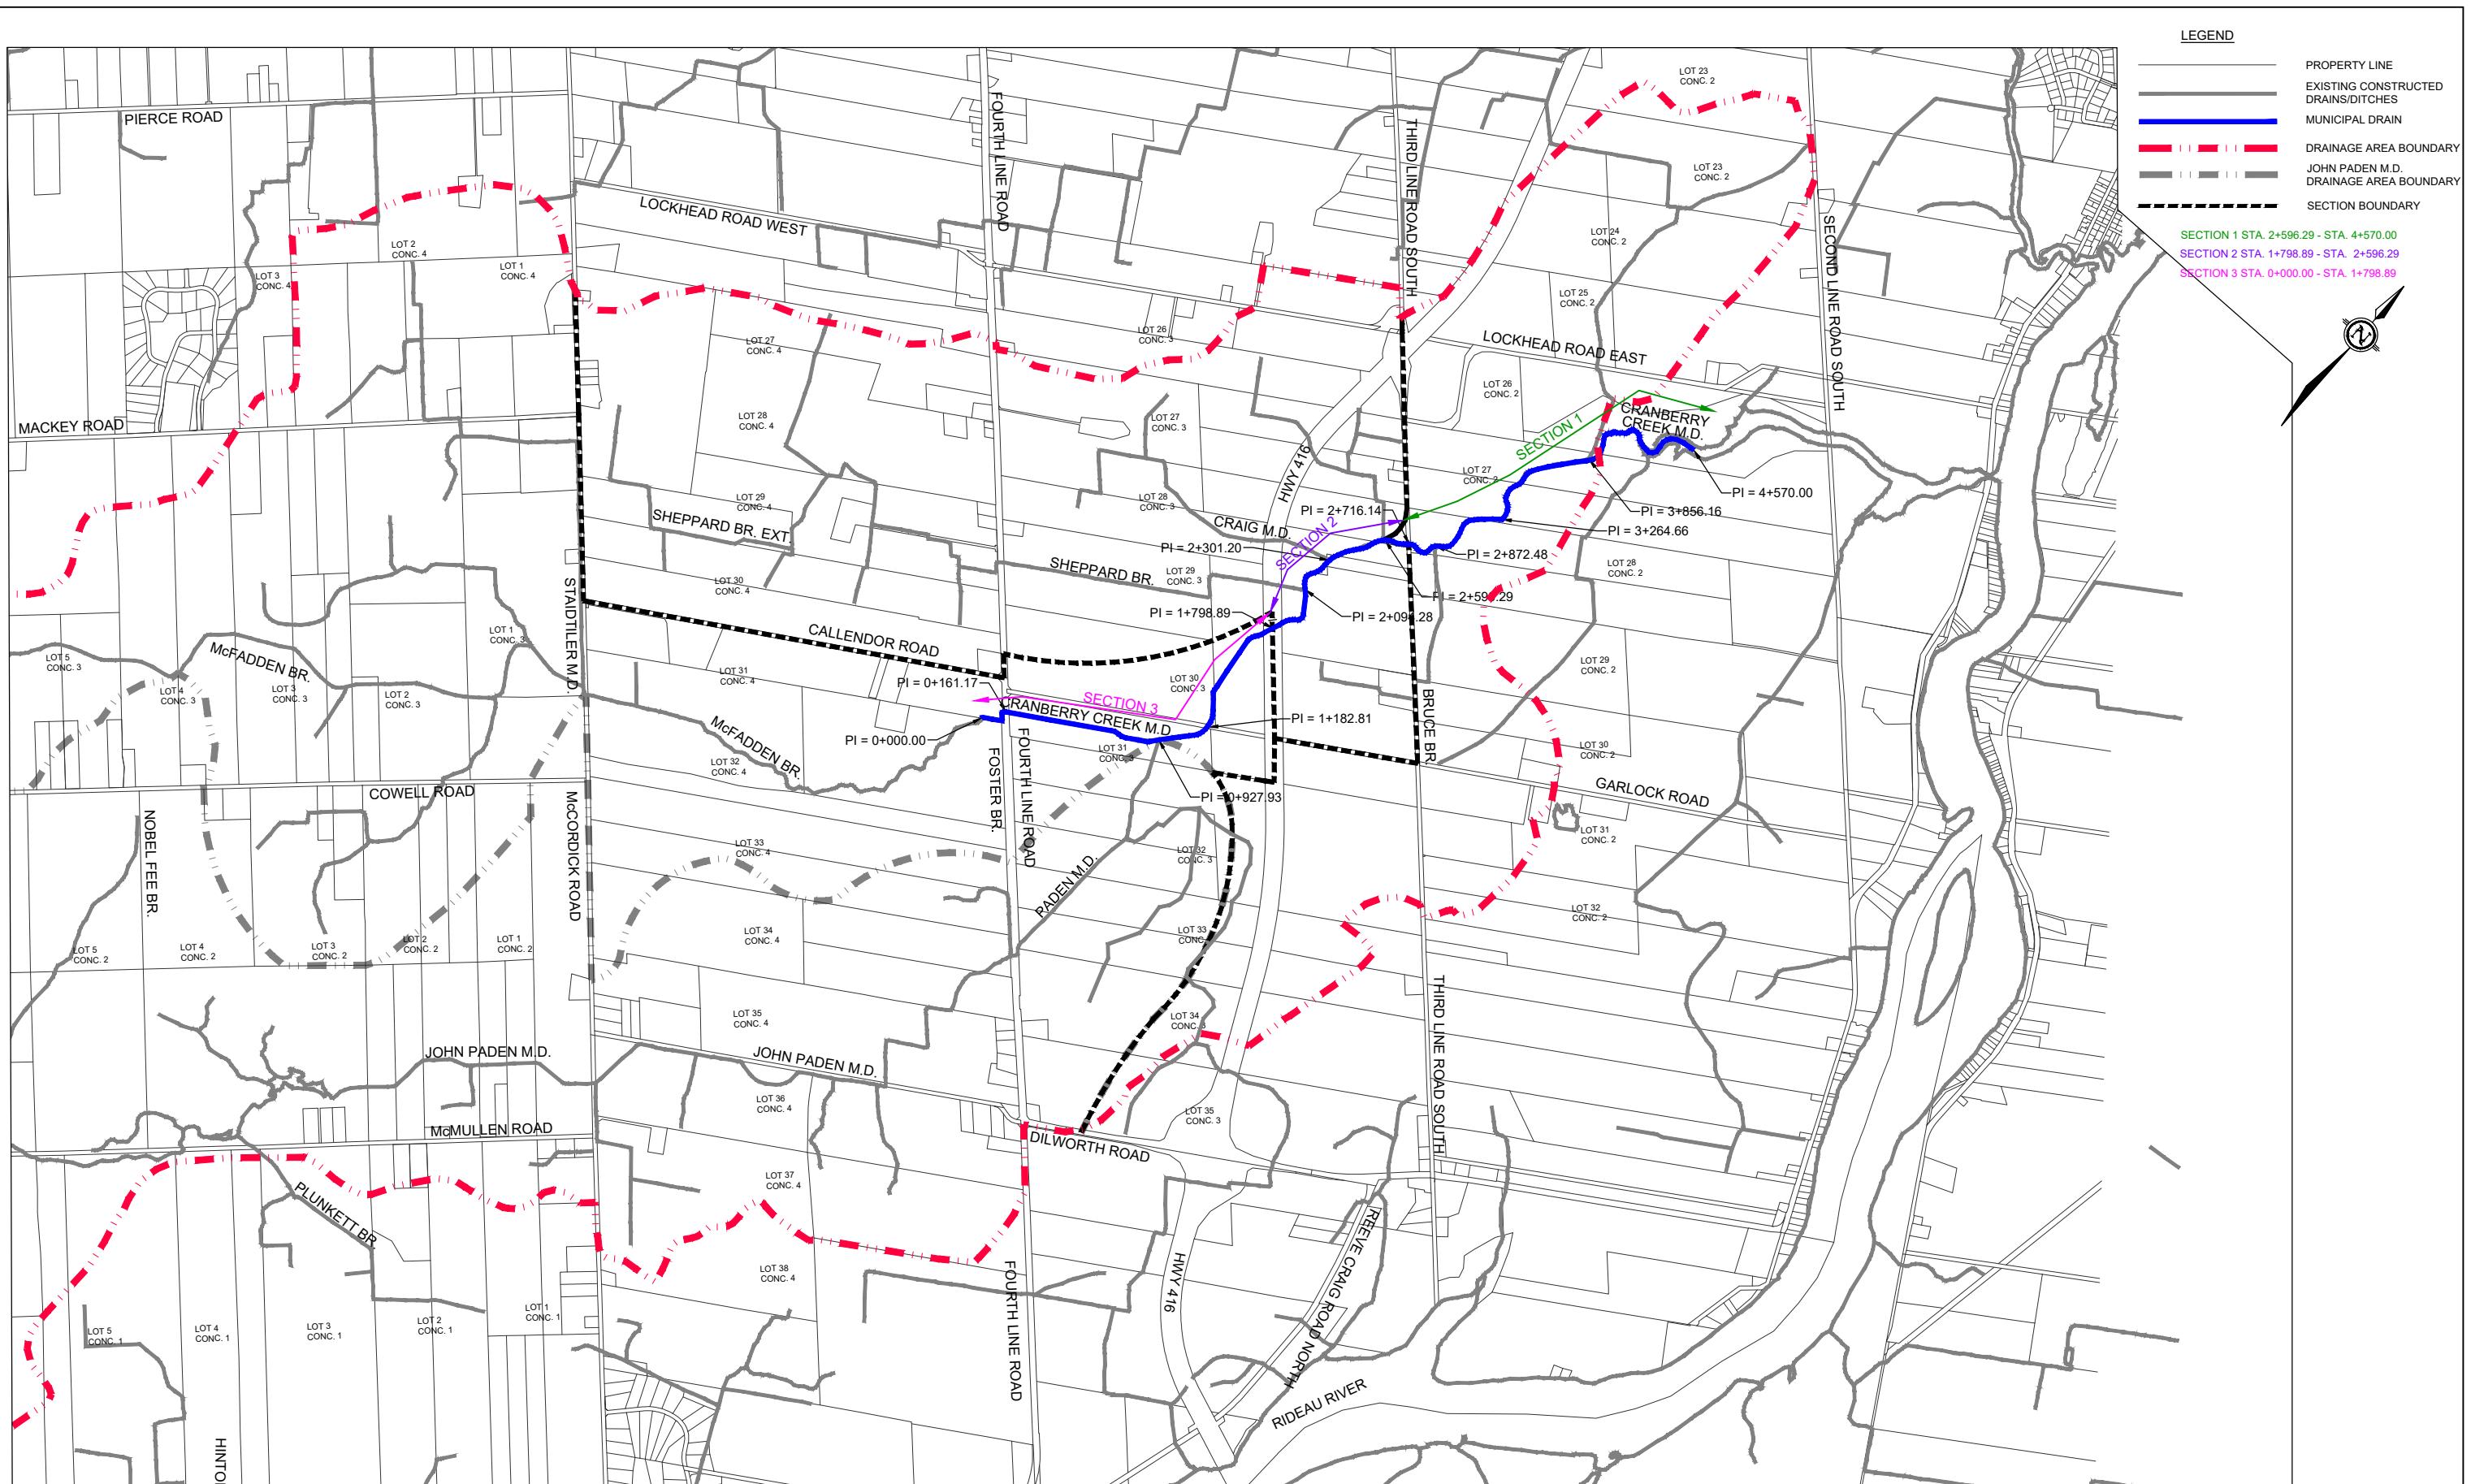

Section 3 is from Sta. 0+000 to Sta. 1+849.43

In addition to the assessment schedules for the three sections of the drain there is a separate assessment schedule for maintenance of the pump station and dyke.

The sections are shown on **Figure 6.1**. The area that is tributary to each of these sections has been determined based on the sub-drainage basins for the various tributary drains. It is important to note that a property could be drained by more than one tributary drain which in turn could result in the property contributing flow to two or more sections of the drain.

In calculating the outlet assessment for the three sections of the Cranberry Creek Municipal Drain indicated in the previous paragraph, each section has been divided into three subsections or parts. The upstream subsection is assigned a factor of one, the middle section is assigned a factor of 0.67 and the downstream subsection is assigned a factor of 0.33. Each individual property is assigned a subsection factor corresponding to the location where the drainage from the property enters the drain. All properties upstream of the section where maintenance is being undertaken are assigned a subsection factor of one. As such, the upstream tributary areas are assigned a subsection factor of one.

The use of the subsection or section factor is based on the principle that all land is assessed for construction or maintenance that is undertaken downstream of the location where the runoff from the land enters the drain.

## 6.8 Land Use Factor

A land use factor was developed to modify the volume and rate of flow anticipated from any give hectare of land within the drainage area to account for the runoff anticipated from lands that are used for different purposes.

Land use factors have evolved based on hydrologic soil groupings developed for use in the HYMO computer model which was originally developed as a tool to calculate volume and peak rates of runoff from agricultural land. A description of the hydrologic soil groups is contained in the United States Department of Agriculture, Natural resources Conservation Service National Engineering Handbook. The MTO Drainage Management Manual utilizes the parameters included in the National Engineering Handbook.

The recently published "A Guide for Engineers Working Under the Drainage Act in Ontario, Publication 852" included Table A9-1 Examples of Adjustment Factors in the Equivalent Area Method. This table includes suggested factors for various land uses based on the calculation of an equivalent factor when compared to agricultural and related vacant or undeveloped land with a factor of one.

The land use factors outlined in the following subsections are based on consideration of the two sources outlined herein since the land use factors have a direct relationship with the runoff from land.

In all cases where an owner subsequently alters the use of the land, they are responsible to notify the Drainage Superintendent and to accommodate amendments as necessary in accordance with Section 65 of the Drainage Act.

### 6.8.1 Non-Protected Lands

- A numeric value of 1.00 is applied to all large lot rural lands including (but not limited to) agricultural land, hobby farms, rural residential greater than 2.0ha, or vacant/undeveloped land.
- A value of 2.00 is applied to small, non-agricultural lots (residential) that have an area of 2.0 Ha or less.
- A value of 3.85 is applied to urban/village properties
- A value of 4.00 is applied to land that is classified as higher density residential, institutional, commercial, road right-of-way, or active railroad.
- A value of 0.70 is applied to unprotected tree/bush land or non-provincially significant wetlands.

## 6.8.2 Protected Lands

- A value of 0.40 is applied to Provincially Significant Wetlands (PSW).
- A value of 0.50 is applied to forested lands protected by an agreement that prohibits future clearing of the land – typically considered in conjunction with a registered Managed Forest Plan under the Managed Forest Tax Incentive Program (MFTIP)

A combined land use factor is applied to properties where more than one (1) significant land use is identified with the relevant factors applied proportionally.

The area of each parcel of land within the drainage basin is multiplied by the land use factor to arrive at a factored area that in turn is used to determine the final benefit and outlet assessment. For example, 1.0 hectare of road right-of-way is assessed at four times (4x) the rate assessed to 1.0 hectare of agricultural land.

## 6.9 Distance Factor

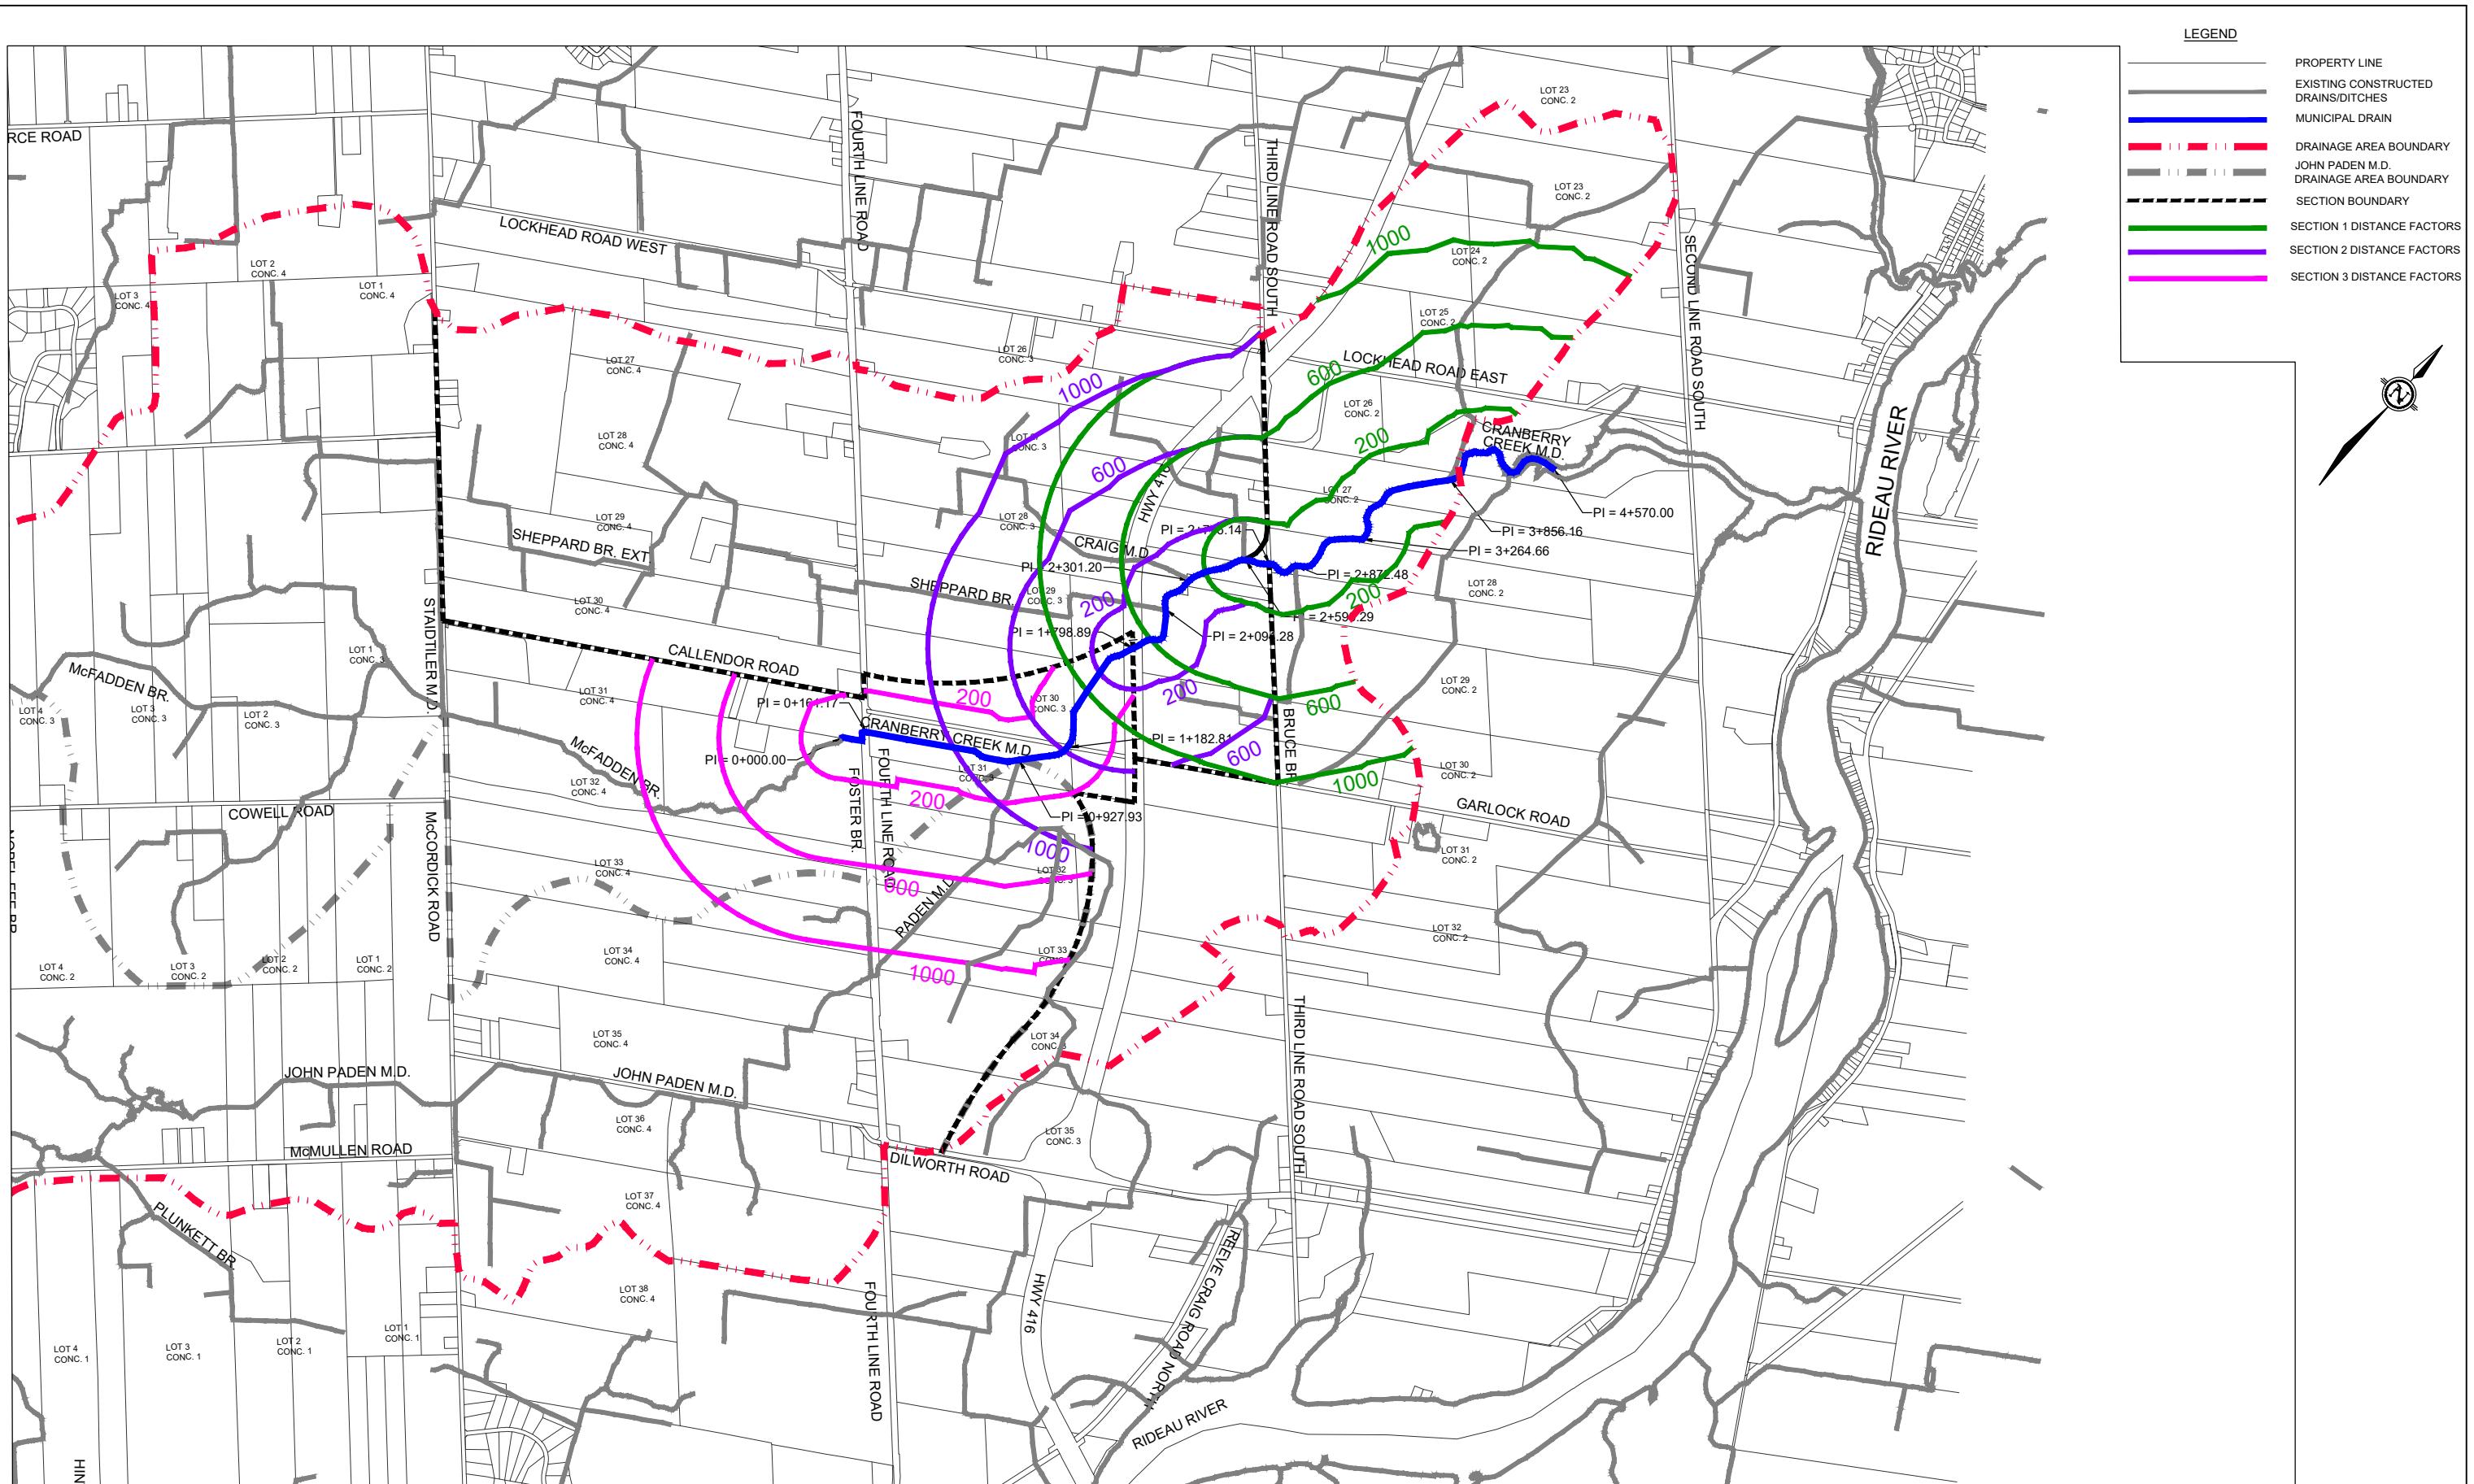

A distance factor was developed to take into account the proximity of land to the drain and the relative amount of water that is estimated to enter the specific section of the drain (volume and rate of flow), accounting for factors including (but not limited to) infiltration, evaporation and temporary or minor impoundments.

A band is drawn on each side of the drain at a distance of approximately 200 metres, a second band is drawn at a distance of approximately 600 metres from the drain, and a third at approximately 1000 metres from the drain. A property that is included entirely within the first band is given a distance factor of 1.0. A property that falls entirely within the second band is given a distance factor of 0.75. A property that falls entirely within the third band is given a distance factor of 0.6 and property that is located beyond 1000 metres from the drain (outside the third band), is given a distance factor of 0.3.

In many cases, a property will not be entirely included within one of the bands. For example, one-half of a property might fall within the first band and the other half might fall in the second band. In this case, a distance factor of 0.875 is assigned to that property. The distance factor information for each section is included on **Figure 6.2**.

## 6.10 Outlet Assessment

Each parcel of land that lies within the drainage basin and is upstream of the location where maintenance is being undertaken pays for a portion of the cost of maintenance through an outlet assessment.

**MUNICIPAL DRAIN**

**DISTANCE FACTORS**

PROJECT No. 21065  
CONTRACT No.  
DATED JUN 2022  
DWG. No. FIG 6.2

The outlet assessment factored area for each property is determined by multiplying the area of each property in the drainage basin by the land use factor, the distance factor and the section or subsection factor. Using the outlet assessment factored area for all of the properties being assessed and the cost of maintenance assigned to outlet assessment, a cost per unit outlet factored area (factored hectare) is determined. This is then multiplied by the total outlet assessment factored area of each property to calculate the outlet assessment that is applied to that property.

### **6.11 Benefit Assessment**

Lands that are located immediately adjacent to the drain are charged a benefit assessment. A benefit assessment for maintenance is only charged against properties in the section where work is being completed. The benefit factored area is determined by multiplying the individual assessed area of each property that is immediately adjacent to the drain, by the land use factor. Using the benefit factored area for all of the properties and the cost of maintenance assigned to benefit assessment, a cost per unit benefit factored area (factored hectare) is determined. This amount is then multiplied by the total benefit factored area of each property to calculate the benefit assessment that is applied to that property.

### **6.12 Land Ownership**

The land ownership is based on the most recent property assessment rolls and map fabric information provided by the City of Ottawa. The land ownership on the Cranberry Creek Municipal Drain is shown on Drawing No. 21065-A2 (A2.1, A2.2, A2.3 and A2.4) in **Appendix A**.

The ownership information is subject to the Municipal Freedom of Information and Protection of Privacy Act (MFIPPA), as such, property ownership information is not shown on the plan. For owner reference, an individual ID No. which is linked to the property Roll Number has been assigned to each affected property within the drainage area as shown on the property ownership plans (Dwg. 21065-A2 (A2.1, A2.2, A2.3 and A2.4) in **Appendix A**) for reference to the Schedules of Assessment.

### **6.13 Assessment Schedules**

As described in this report, the drain has been divided into three sections for the purpose of developing Assessment Schedules for future maintenance and repair of the drain. The land area, land use factor, section or subsection factor and distance factor have been entered into an Excel spreadsheet for each of the three sections of the drain. The total area of each land parcel is further divided as required placing the appropriate portion of area in each section of the drain. The individual Excel spreadsheets for each section are linked to a summary sheet. Once the total cost of future maintenance and repair is determined, this amount can be entered on the appropriate spreadsheet and the outlet, benefit and total assessments are calculated. Where the one-third grant on agricultural land, as

noted by the “\*\*” in the ADIP Grant Eligibility column, is applicable, the one-third grant can be deducted from the total assessment to arrive at the net cost assessed against the property. The Drainage Superintendent should modify the schedules to apply the amount of grant that is in existence at the time that maintenance is undertaken.

In developing the Assessment Schedule for future maintenance and repair of the drain, the portion of the cost for outlet and benefit has been entered for each section of the drain to reflect the relative use of the drain by landowners in each of the areas of the drain, then the cost associated with each area has been further assessed to individual landowners in each area and in the larger watershed. The portion of the cost charged to outlet increases with the size of the drain and the total area being served. The Assessment Schedules for the various sections with the percentage split between Outlet Assessment and Benefit Assessment are as follows:

#### **Summary Schedule of Assessment**

Section 1 – Sta 2+716.68 to Sta. 4+572.02

90%	Outlet Assessment
10%	Benefit Assessment

Section 2 – Sta. 1+849.43 to 2+716.68

85%	Outlet Assessment
15%	Benefit Assessment

Section 3 – Sta. 0+000 to Sta. 1+849.43

75%	Outlet Assessment
25%	Benefit Assessment

#### Dyke and Pump Station

0%	Outlet Assessment
100%	Benefit Assessment

Assessments for future maintenance will be charged to landowners in the drainage basin in proportion to the Assessment Schedules included in **Appendix B**.

The total amount per section of the drain, as well as the amount assigned to each property as shown on the Assessment Schedules, is for the cost associated with this Section 76 Engineer's Report. Once maintenance or repair is completed the actual cost will be assigned in proportion to the distribution in the Assessment Schedules for the section of the drain where maintenance or repair is completed.

Schedule A is a summary of the distribution of costs to individual landowners, blocks and roads and includes all costs allocated (per section) included in Schedules B through E for maintenance and or repair of the main drain.

Schedule B stipulates the distribution of costs associated with Section 1 of the Cranberry Creek Municipal Drain.

Schedule C stipulates the distribution of costs associated with Section 2 of the Cranberry Creek Municipal Drain.

Schedule D stipulates the distribution of costs associated with Section 3 of the Cranberry Creek Municipal Drain.

Schedule E stipulates the distribution of costs associated with the pump station and dyke on the Cranberry Creek Municipal Drain...

The amounts included in Schedule A indicate the total assessment assuming future maintenance and repair is completed on all sections of the main drain as well as the pump station and dyke.

## **7.0 MAINTENANCE AND REPAIR**

The present report is only for the completion of updated Assessment Schedules to assess the cost for maintenance and repair. General maintenance and repair shall be assessed as per Schedules B through D respective to location of work. Maintenance and repair related to the pump and dyke to be assessed as per Schedule E.

The specifications and scope of future maintenance and repair continue to be governed by the 1969 Engineer's Report, entitled "Engineer's Report – Cranberry Creek Municipal Drain – Township of North Gower" prepared by Graham, Berman and Associates Limited, dated March 24, 1969 (By Law No. 30-69) and the 1971 Engineer's Report, entitled "Engineer's Report – Cranberry Creek Improvement Municipal Drain – Township of North Gower" prepared by A.J. Graham Engineering Consultants Limited, dated Revised September 10, 1971 (By-Law 28-71).

## **8.0 ASSESSMENT OF REPORT COST**

The estimated cost associated with the Section 76 Engineer's Report for new Assessment Schedules is \$26,500 plus HST. As prescribed by the Guide for Engineer's Working under the Drainage Act in Ontario (Publication 852) the cost of this report is not eligible for a grant.

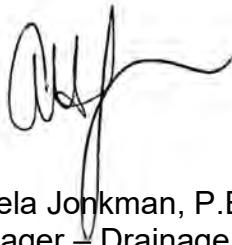

The cost associated with the preparation of this Section 76 Engineer's Report for new Assessment Schedules is to be assessed to the property owners. The total cost of the Engineer's Report is to be distributed in four equal amounts to each of the three sections of the municipal drain and the pump station and dyke and will be assessed to properties in accordance with the Assessment Schedules in the report.

All of which is respectfully submitted,
